

All About Birds

(Answer Version)

Name: _____ Class: _____ Student No.: _____

According to research data, Hong Kong is home to nearly 450 bird species, accounting for about one-twentieth of the world's total. Among these, around 90 are resident species, while over 300 are migratory birds. This incredible diversity is thanks to Hong Kong's unique geography and rich habitats. Nestled at the mouth of the Pearl River, with mountainous terrain and varied ecosystems, Hong Kong offers ideal conditions for birds to thrive.

In addition, Hong Kong sits along the East Asian-Australasian Flyway, making it an important stopover and wintering ground for migratory birds traveling between northern and southeastern Asia, further enhancing its avian diversity.

Common Bird Species in Hong Kong

Tree Sparrow

- Upper parts of the plumage are brownish
- Cheek and throat with black spots which are indistinct or missing in juveniles
